• For backup: initiated by user or system back up
• Automated transfer of data from science instrument
Staging data with compute jobs

• Stage data in or out as part of the job
• Transfer task is submitted when the job is run
  – Endpoint may not be currently activated
• Alternative approaches
  1. User adds directives to job submission script
  2. Application manages data staging on user’s behalf
Application driven automation

- Application (e.g. portal, science gateway) submits a transfer of compute results as the user
- Application monitors transfer, and initiates additional processing and/or backup of data
Relevant Platform Capabilities
Globus Auth: Native apps

- **Client that cannot keep a secret, e.g…**
  - Command line, desktop apps
  - Mobile apps
  - Jupyter notebooks

- **Native app is registered with Globus Auth**
  - Not a confidential client

- **Native App Grant is used**
  - Variation on the Authorization Code Grant

- **Globus SDK:**
  - To get tokens: NativeAppAuthClient
  - To use tokens: AccessTokenAuthorizer
Native App grant

1. Run application

2. URL to authenticate

3. Authenticate and consent

4. Auth code

5. Register auth code

6. Exchange code

7. Access tokens

8. Authenticate with access tokens to invoke transfer service as user

Browser

Native App (Client)

Globus Auth
(Authorization Server)

App/Service
(Resource Server)
Refresh tokens

- **Common use cases**
  - Portal checking transfer status when user is not logged in
  - Running command line app from script

- **Refresh tokens issued to client, in particular scope**

- **Client uses refresh token to get access token**
  - Confidential client: client_id and client_secret required
  - Native app: client_secret not required

- **Refresh token good for 6 months after last use**

- **Consent rescindment revokes resource token**
Refresh tokens

1. Run application
2. URL to authenticate
3. Authenticate and consent
4. Auth code
5. Register auth code
6. Exchange code, request refresh tokens
7. Access tokens and refresh tokens
8. Store refresh tokens
9. Exchange refresh token for new access tokens
10. Access tokens
11. Authenticate with access tokens to invoke service as user

App/Service (Resource Server)
Native App/Refresh Tokens Sample Code

github.com/globus/native-app-examples

• ./example_copy_paste.py
  – User copies and pastes code to the app

• ./example_copy_paste_refresh_token.py
  – Stores refresh token locally, uses it to get new access tokens

• See README for installation

On your EC2 instance in ~/native-app-examples
Automation via the Globus CLI
Globus Command Line Interface (CLI)

- Native application, with easy installation/update
- `globus login` – get access and refresh tokens
  - Tokens stored locally in `~/.globus.cfg`
- Service (transfer/auth) invocation uses tokens
- `globus logout` – delete tokens

[docs.globus.org/cli/examples](docs.globus.org/cli/examples)

Also available on your EC2 instance
UUIDs everywhere

- UUIDs for endpoint, task, user identity, groups...
- Use search/list options
- `get-identities for identity username to UUID`

```
$ globus endpoint search 'Globus Tutorial'
$ globus task list
$ globus get-identities vas@globus.org bfc122a3-af43-43e1-8a41-d36f28a2bc0a
```
Batch Transfers

- Transfer tasks have one source/destination, but can have any number of files
- Provide input source-dest pairs via local file
- e.g. move files listed in files.txt from $ep1 to $ep2

```bash
$ ep1=ddb59aef-6d04-11e5-ba46-22000b92c6ec
$ ep2=ddb59af0-6d04-11e5-ba46-22000b92c6ec
$ globus transfer $ep1:/share/godata/ $ep2:/~/ --batch --label 'CLI Batch' < files.txt
```
Parsing CLI output

- Default output is text; for JSON output use `--format json`

```
$ globus endpoint search --filter-scope my-endpoints
$ globus endpoint search --filter-scope my-endpoints --format json
```

- Extract specific attributes using `--jmespath <expression>`

```
$ globus endpoint search --filter-scope my-endpoints --jmespath 'DATA[].[id, display_name]'```
Managing notifications

- Turn off emails sent for tasks
- Useful when an application manages tasks for a user
- Disable notifications with the `--notify` option
  - `--notify off` (all notifications)
  - `--notify succeeded|failed|inactive` (select notifications)
Permission management

- Set and manage permissions on shared endpoint
- Requires access manager role

```bash
$ share=<shared_endpoint_UUID>
$ globus endpoint permission create --permissions r --identity tuecke@globus.org $share:/NCARTest/
$ globus endpoint permission list $share
$ globus endpoint permission delete $share <perm_UUID>
```
Automation with CLI

• **Script transfers data repeatedly via task manager/cron**
  – Interactions are as user: both for data access and to Globus services

• **CLI commands used in job submission script**
  – CLI is installed on head node
  – User runs `globus login`; tokens stored in user’s home directory
  – Tokens accessible when job runs and submits stage in/out tasks
  – Use `--skip-activation-check` to submit task even if endpoint is not activated at submit time
Automation with portals

- Portal needs to act as the user
- User grants “offline” access to the portal
  - Portal gets and stores refresh tokens for each user
  - Uses client id/secret + refresh tokens to get new access tokens
  - Portal maintains state about transfers being managed (task id)
Useful submission options

• **Safe resubmissions**
  – Applies to all tasks (transfer and delete)
  – Get a task UUID and use it in submission
  – `globus task generate-submission-id`
  – Use `--submission-id` option in transfer command

• **Task wait**
  – Useful for scripting conditional on transfer task status
Walkthrough

- Sample script that uses sync option to transfer files
  
  [GitHub Link]

- Same task, via an app that uses Python SDK
